*RECOMMEND RESERVOIR SIZE..... MINIMUM 30 GAL.*

## **Initial Installation and Start-Up**

**Be sure you set the hydraulic flow (GPM) to the generator at Approximately 62.5 HZ or 3750 RPM with NO electrical load on the generator.**

**By using this setting you will have approximately 60HZ (cycles) or 3600 RPM when you are running at full rated load.**

**One way this can be accomplished is by using a Photo Tachometer on our generator coupling or generator cooling fan.**

*A Photo Tachometer is an inexpensive tool that can be purchased at McMasters, Grainger, Sears or any other electrical supplier.*

## **INSTALLATION TIPS**

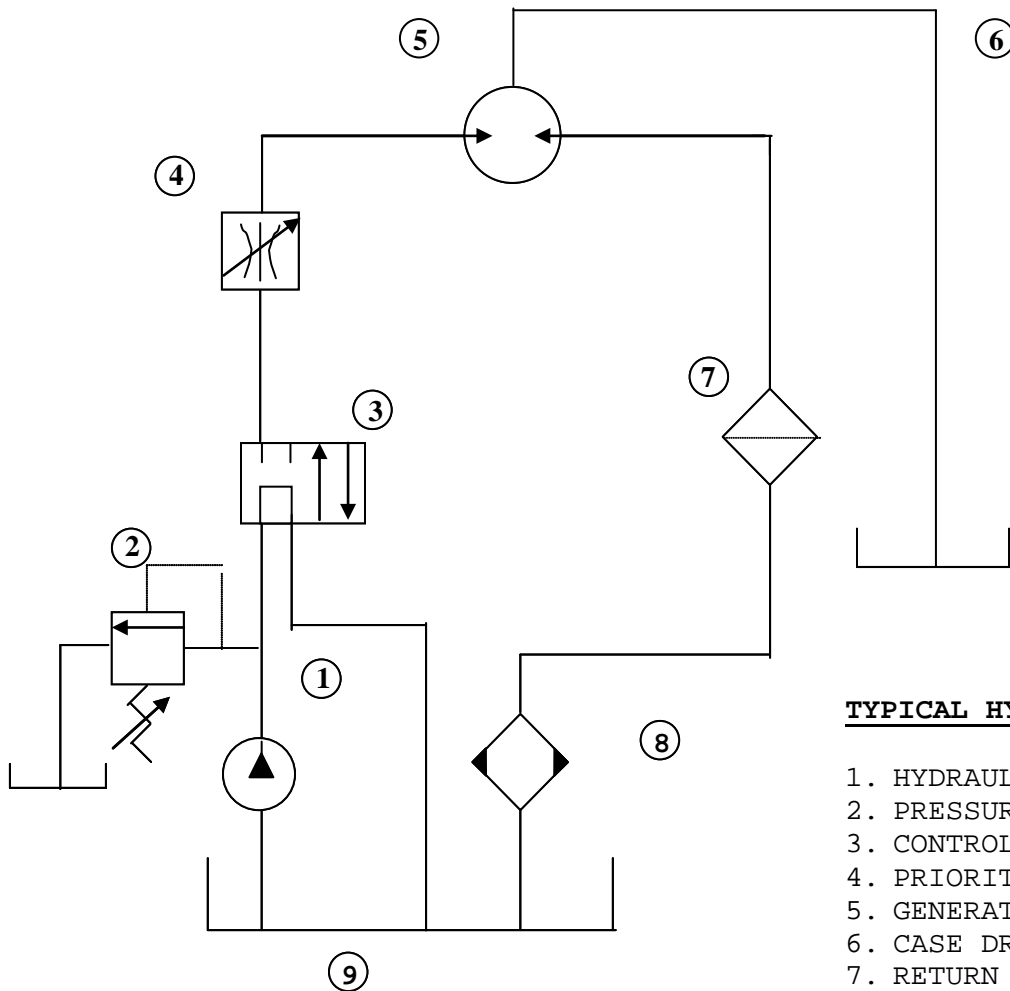

Excessive pressure in your return line will damage the hydraulic motor seal. High back pressure can be caused by “spikes” sent back through the return from other equipment on a common return line. Another potential problem can develop if several pieces of equipment are connected to one “common” return line causing a high back pressure (150 PSI is the maximum). We recommend you run the return line from the generator back to the cooling tank with a separate line.

If our hydraulic generator is to be used on a truck or system that will be changing speeds, such as, in a fire truck (pumping water) we suggest you use a load sensing piston type pump rather than a fixed displacement gear type. The system will run much cooler and more efficient.
